

TEFLON DIE CARE

HOW TO CARE FOR YOUR NEW DIE

Your new die is coated with commercial grade, FDA approved Teflon coating to provide a non-stick surface. To keep your die in good shape, we recommend the following care to maximize your coating lifespan.

HEAT

No, Low and moderate heat are the optimal conditions for your die. Too high of heat can cause your fats to burn on your die. Never leave a heated die unattended for long periods. Frequent wiping down of die will also help reduce baked on fats. Avoid drastic temperature changes, such as placing a hot die in cold water.

CLEANING

The best way to clean your die is to use soap and hot water.

- DO NOT use abrasive chemicals or cleaners on the Teflon surface.
- DO NOT use an abrasive sponge / steel wool / wire brush or anything that can scratch or gouge Teflon coating.

STORING AND USAGE

Take care when using / cleaning / dismantling your die to not scratch the surface. When storing your die, we suggest ensuring it is always set on a clean surface, never dragged across a counter-top and not put in situations where it can become scratched – such as carried against a coat/shirt with an exposed zipper, etc. Some clients choose to wrap or rest die on a soft, clean non-abrasive material (such as paper towels) to ensure that it is protected when not in use or being dismantled.

COATING LIFESPAN

Your coating lifespan will depend on care and usage. While the material is FDA approved, excessive scratches and flaking of the coating is a sign that it is time to replace.

Should you have an unfortunate accident, or your coating has simply reached its end of life, just arrange to send your die punch in. The old coating can be removed and recoated.
